

### Add and Subtract: IIT Innovation Center

The concept behind this project is to try to keep the context of the school campus as much as possible, while trying to either adding or subtracting different elements to give more insights of the futuristic trend the school is undertaking. Here the simplistic form of Hermann Hall is controlled and manipulated by adding strictly geometrical masses and protrusions to the main profile. Other than the enlargement of scale to the structure, the skins on the new masses also changed to a window louver system, which is also incorporated into the geometric mass inside the structure as well. Overall this concept capitalize the “Universal Space” inside many Miesian structures into more distinct and useful programs.
